You can download it free of charge to your computer.Q: How to make a JQuery Dialog responsive when shown from a container I'm creating a webapp that's using a webcomponents to create a pop-up like JQuery dialog. The webcomponents is used as a framework to create things like a search engine for a website. When using a framework I've learned that it's easy to get into bad habits and I want to avoid that. This JQuery dialog is dynamically created from some container like div. So when it's shown the container's height gets increased. But the pop-up is not re-sized automatically. I'm wondering how I can solve this problem so that the pop-up is also resized (if you could) when the container's height gets increased. The html I use to create the pop-up: 82157476af
